

Growth_mort

Carmen

October 31, 2019

This script runs simulations with the most up-to-date functions

Define parameters

```
fire <- "AMRC"
year <- "2016"
years <- 20
iterations <- 10
max_shrub_ht_cm <- 250
max_shrub_ht_years <- 15
n_seedlings <- 100
length_m <- 40
height_m <- 40
lambda <- 4
shrub_clumpiness <- 7
```

Load functions

Create shrub patch

```
source("functions/shrubclump.R")
```

Initialization function

```
source("functions/initialize.R")
```

Height growth functions

```
source("functions/abcogrowth.R")
source("functions/pipogrowth.R")
```

Diameter growth functions

```
source("functions/abcodia.R")
source("functions/pipodia.R")
```

Mortality functions

```
source("functions/abcomort.R")
source("functions/pipomort.R")
```

Shrub growth function

```
source("functions/shrubgrowth.R")
```

Simulation function

```
source("functions/sim.R")
```

Iteration function

```
source("functions/iterate.R")
```

Initialize

Create clumped shrub pattern

```
shrubclump()  
plot(r)
```

Randomly select seedlings from data and place them on the shrub patch

```
initialize()
```

```
## Joining, by = "ID"
```

```
## Joining, by = "Sdlg"
```

```
## Warning: Column `Sdlg` joining factors with different levels, coercing to
```

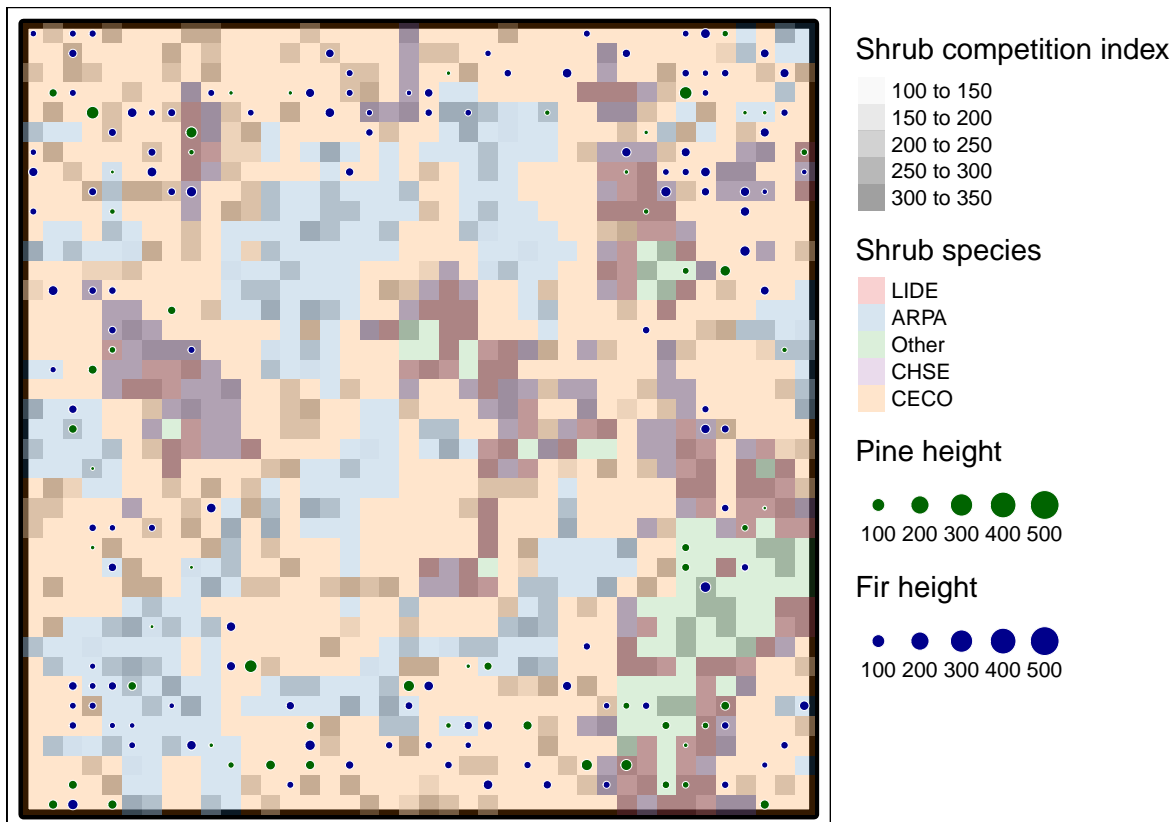

```
## character vector
```

Plot patch with seedlings

```
max_shrub <- max(r@data@attributes[[1]]$sqrt_shrubarea3)
r@data@attributes[[1]]$shrub_rel <- r@data@attributes[[1]]$sqrt_shrubarea3/max_shrub
```

```
pts.sf.pipo.graph <- pts.sf.pipo %>%
  rename("Pine height" = Ht_cm1)
pts.sf.abco.graph <- pts.sf.abco %>%
  rename("Fir height" = Ht_cm1)
```

```
tm_shape(p)+
  tm_borders(col = "black", lwd= 5)+
tm_shape(r)+
  tm_raster(col = "sqrt_shrubarea3", title = "Shrub competition index", palette = "Greys", alpha = .5)+
tm_shape(r)+
  tm_raster(col = "ShrubSpp03", alpha = .2, title = "Shrub species", palette = "Set1")+
  tm_layout(asp=1:1, legend.outside = T)+
tm_shape(pts.sf.pipo.graph)+
  tm_symbols(size = "Pine height", col = "darkgreen", size.max = 500, border.col = "white", border.lwd = 1)+
tm_shape(pts.sf.abco.graph)+
  tm_symbols(size = "Fir height", col = "darkblue", size.max = 500, border.col = "white", border.lwd = 1)
```

Simulate across years

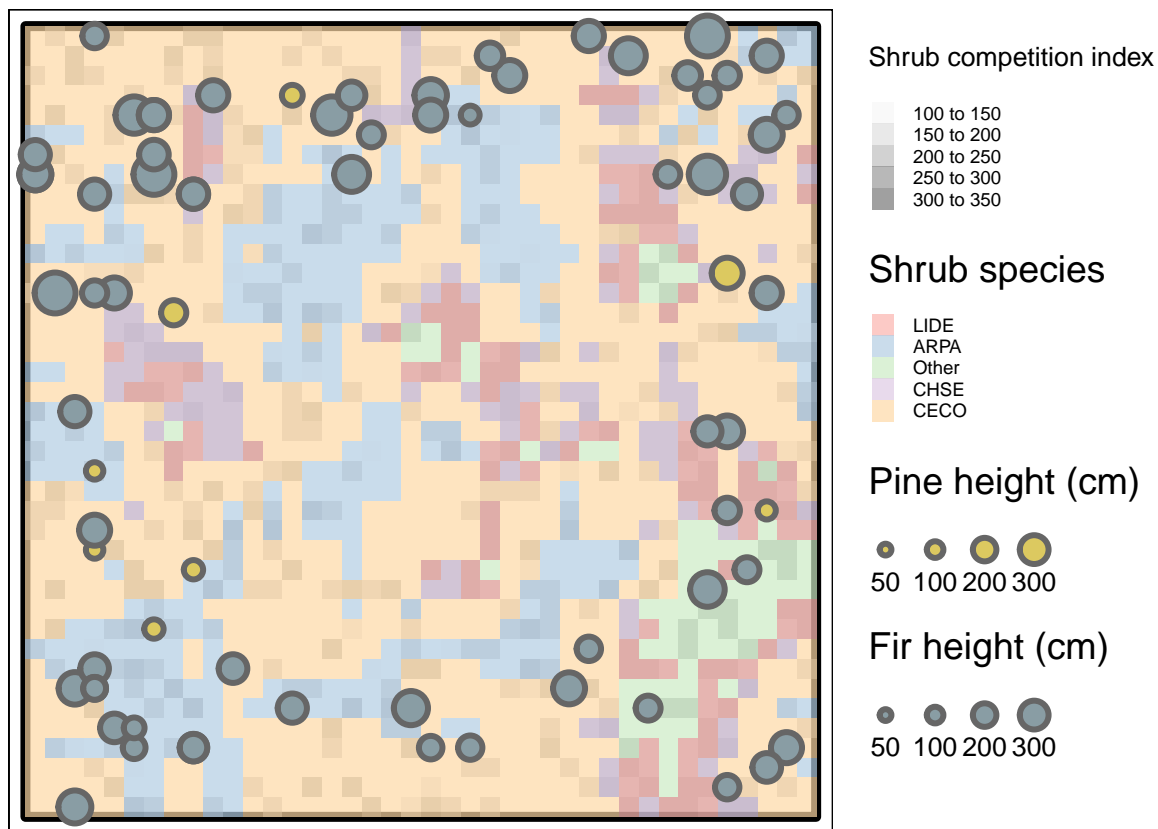

```
suppressMessages(sim(years))
```

```
pts.sf.pipo.graph <- pts.sf.pipo %>%
  rename("Pine height (cm)" = Ht_cm1)
pts.sf.abco.graph <- pts.sf.abco %>%
  rename("Fir height (cm)" = Ht_cm1)
```

```
tm_shape(p)+
  tm_borders(col = "black", lwd= 5)+
tm_shape(r)+
  tm_raster(col = "sqrt_shrubarea3", title = "Shrub competition index", palette = "Greys", alpha = .5)+
tm_shape(r)+
  tm_raster(col = "ShrubSpp03", alpha = .7, title = "Shrub species", palette = "Pastell1")+
  tm_layout(asp=1:1, legend.outside = T, legend.title.size = 4, legend.text.size = 2)+
tm_shape(pts.sf.pipo.graph)+
  tm_symbols(size = "Pine height (cm)", col = "#DCC960", size.max = 300, border.lwd = 3)+
tm_shape(pts.sf.abco.graph)+
  tm_symbols(size = "Fir height (cm)", col = "#899DA4", size.max = 300, border.lwd = 3)
```

Note that 1 values of the variable "Pine height (cm)" (the highest being 347.168965616511) are large

Note that 36 values of the variable "Fir height (cm)" (the highest being 604.870825878987) are large

Iterate

```
iterate(iterations)
dfsimallreps %>%
```

```
group_by(rep) %>%
  summarize(mean(Ht_cm1))
```

```
## # A tibble: 10 x 2
##       rep `mean(Ht_cm1)`
##   <int>     <dbl>
## 1     1     131.
## 2     2     128.
## 3     3     131.
## 4     4     128.
## 5     5     124.
## 6     6     126.
## 7     7     132.
## 8     8     128.
## 9     9     131.
## 10    10     129.
```

Summarize

Height by year

```
dfsimplallreps_summary <- dfsimplallreps %>%
  ungroup() %>%
  mutate(rep = as.factor(paste(rep))) %>%
  group_by(rep, Years, Species) %>%
  mutate(mean_ht_years = mean(Ht_cm1))
dfsimplallreps_summary %>% dplyr::select(rep, Years, mean_ht_years) %>% summary()
```

```
## Adding missing grouping variables: `Species`
```

```
## Species      rep      Years      mean_ht_years
## ABC0:19112    2      : 2903    Min.      : 9.00    Min.      : 42.58

```

```
print(Sys.time() - strt)
```

```
## Time difference of 1.074573 mins
```

Next steps to improve the model

1. Use Kristen's data or Hugh's data for initial conditions
2. Improve dispersal kernel based on Kristen/Hugh's data
3. Improve shrub growth based on data
4. Include residual surviving trees and their seed dispersal
5. Include seed dispersal of post-fire regen once it reaches reproductive age
6. Add customization of patch size and shape
7. Add customization of whether the conditions reflect those of 2015, 2016, or 2017
8. Change sapling growth equations once they emerge from the shrub canopy

For next week: - Improve shrub growth based on data - display dominant shrub species - make the shrub grid dependent upon surrounding cells so it's not so checkerboard - Update display of shrub competition after simulation years - what does shrub competition mean for new recruitment? - "emergent year" = when 50% of trees are above shrub canopy - maybe submit to American Naturalist - Global Change Biology - mixing up the years - no overstory reproduction for now - apply to King, American River Complex, rest of the fires I measured - switch diameter equation to be from dendro work
